Distributed AI as a rural heat resource

Same 63.96 MW compute service; siting changes what the heat can displace

Single campus
63.96 MW IT

heat rejected to ambient

redistribute compute

11 liquid-cooled nodes
13 municipalities
dedicated dark-fibre fabric

Recovered heat — the distribution-specific climate mechanism

District heating
4,934 homes

Alfalfa drying
79.6 GWh heat

Greenhouses +
aquaculture

Integrated community programme — enabled by project finance, not uniquely by distribution

EVs + renewable fuels

Manure → biomethane
30.3 GWh yr^{-1}

Cooking +
farm machinery +
off-network heat

45.1 ktCO$_2$e yr^{-1}	81 kgCO$_2$e/MWh IT	68%	69.7%
fossil-heat emissions displaced	primary siting metric	territorial emissions reduction	integrated programme screen

Only recovered-heat displacement is physically attributable to distributed siting.

Programme-financed measures and food-system substitution are reported separately.
